PILLAR 3 DISCLOSURE
AS AT 30 JUNE 2017

Overview

This document discloses Bank Islam Group's ("the Group") quantitative disclosures in accordance with the disclosure requirements as outlined in the Capital Adequacy Framework for Islamic Banks ("CAFIB") – Disclosure Requirements ("Pillar 3") issued by Bank Negara Malaysia ("BNM").

The Group has adopted the Standardised Approach in determining the capital requirements for credit and market risk and has applied the Basic Indicator Approach for operational risk for the Pillar 1 since January 2008. Under the Standardised Approach, standard risk weights are used to assess the capital requirements for exposures in credit and market risk whilst the capital required for operational risk under the Basic Indicator Approach is computed based on a fixed percentage over the Group's average gross income for a fixed number of quarterly periods.

In compliance with the Pillar 3 Disclosure Policy, the Pillar 3 Disclosure for the Group is being regularly prepared for two periods: 30 June and 31 December. The Group's Pillar 3 Disclosure will be made available under the Corporate Info section of the Bank's website at www.bankislam.com.my, attached to its annual and the half-yearly financial reports after the notes to the financial statements.

The following tables show the minimum regulatory capital requirement to support the Group's and the Bank's risk weighted assets.

4. Market Risk

a) Profit Rate Risk in the Non-Trading Portfolio

Profit rate risk in the non-trading portfolio is managed and controlled using measurement tools known as Economic Value of Equity (“EVE”) and Earnings-at-Risk (“EaR”). EVE and EaR limits are approved by the BRC and independently monitored by MRMD.

The Group manages market risk in non-trading portfolios by monitoring the sensitivity of projected EVE and EaR under varying profit rate scenarios (simulation modeling). For simulation modeling, a combination of standard scenarios and non-standard scenarios relevant to the local market are used. The standard scenarios monitored monthly include a 100 basis points parallel fall or rise in profit rate and historical simulation. The scenario assumes no management action. Hence, it does not incorporate actions that would be taken by Treasury to mitigate the impact of the profit rate risk. In reality, depending on the view on future market movements, Treasury would proactively seek to change the profit rate exposure profile to minimise losses and to optimise net revenues. The nature of the hedging and risk mitigation strategies corresponds to the market instruments available.

These strategies range from the use of derivative financial instruments, such as profit rate swaps, to more intricate hedging strategies to address inordinate profit rate risk exposures.

The table below shows the projected sensitivity to a 100 basis points parallel shift to profit rates across all maturities applied on the Bank’s profit rate sensitivity gap as at reporting date.

	30 June 2017		31 December 2016	
	(Decrease) / Increase		(Decrease) / Increase	
	-100bps	+100bps	-100bps	+100bps
	RM Million	RM Million	RM Million	RM Million
Bank				
Impact on EaR	(51.81)	51.81	(28.46)	28.46
Impact on EVE	255.20	(255.20)	266.25	(266.25)

Other controls to contain profit rate risk in the non-trading portfolio include applying sensitivity limits to the Available for Sale (“AFS”) financial assets. Sensitivity is measured by the present value of a 1 basis point change (“PV01”).

4. Market Risk (continued)

b) Market Risk in the Trading Portfolio

Market risk in the trading portfolio is monitored and controlled using Value-at-Risk (“VaR”). VaR is a technique that estimates the potential losses that could occur on risk positions as a result of movements in market rates over a specified time horizon and to a given level of confidence. The VaR model used by the Group is based on historical simulation. The model derives plausible future scenarios from past series of recorded market rates.

The historical simulation model used by the Group incorporates the following features:

- Potential market movements are calculated with reference to data from the past four years;
- Historical market rates are calculated with reference to foreign exchange rates and profit rates;
- VaR is calculated to a 99 per cent confidence level and for a one-day holding period. The nature of the VaR model means that an increase in observed market volatility will lead to an increase in VaR without any changes in the underlying positions; and
- The dataset is updated on daily basis.

Statistically, the Group would expect to see losses in excess of VaR only 1 per cent of the time over a one-year period. The actual number of excesses over this period can therefore be used to gauge how well the model is performing.

A summary of the Bank’s VaR position for the trading portfolios as at the reporting date is as follows:

Bank	30 June 2017	1 January 2017 to 30 June 2017		
	RM million	Average RM million	Maximum RM million	Minimum RM million
Profit Rate Risk	2.44	1.68	3.29	0.59
Foreign Exchange risk	0.15	0.18	0.55	0.01
Overall	2.58	1.87	3.67	0.62

Bank	31 December 2016	1 January 2016 to 31 December 2016		
	RM million	Average RM million	Maximum RM million	Minimum RM million
Profit Rate Risk	1.39	2.09	4.34	0.94
Foreign Exchange risk	0.04	0.13	0.52	0.01
Overall	1.43	2.22	4.81	0.95

4. Market Risk (continued)

b) Market Risk in the Trading Portfolio (continued)

Although a valuable guide to risk, VaR should always be viewed in the context of its limitations. For example:

- The use of historical data as a proxy for estimating future events may not encompass all potential events, particularly those which are extreme in nature;
- The use of a one-day holding period assumes that all positions can be liquidated or hedged in one day. This may not fully reflect the market risk arising at times of severe illiquidity, when a one-day holding period may be insufficient to liquidate or hedge all positions fully;
- The use of a 99 per cent confidence level, by definition, does not take into account losses that might occur beyond this level of confidence;
- VaR is calculated on the basis of exposures outstanding at the close of business day and therefore does not necessarily reflect intra-day exposures; and
- VaR is unlikely to reflect the loss potential on exposures that might arise under significant market movements.

The Group recognises these limitations by augmenting the VaR limits with other limits such as maximum loss limits, position limits and PV01 limits.

c) Foreign Exchange Risk

Trading Positions

The Group controls the trading portfolio foreign exchange risk by limiting the non-Ringgit open exposure to individual currencies and on an aggregate basis.

Overall (Trading and Non-Trading Positions)

The Group controls the overall foreign exchange risk by limiting the non-Ringgit open exposure on an aggregate basis.
